

FIN5545 Project B Report

Student: z5702740

This report documents a reproducible Project B baseline. The script builds equity-only, crypto-only, and combined equity-plus-crypto systematic funds. Weights are estimated using only past data in a 126-trading-day lookback window, then applied out of sample with monthly rebalancing. The sentiment index uses headline text aggregated by equity sector and lags the signal by one day to reduce look-ahead bias. The Streamlit app should load the precomputed CSV outputs rather than rerunning the full backtest.
